## Class Diagram(s)

## ER Diagram(s)

## Information Architecture Diagram

PetAlert originally followed a fully local-first architecture in Sprint 2.

In Sprint 3, the architecture was expanded to include **Firestore Authentication**, while all pet-related data (pet profiles, contacts, and missing alerts) continue to be stored **locally on the device** for offline reliability.

## Sharing Missing Alert

Homescreen is loaded in the android emulator.

Add pet feature:

A mobile application interface for adding a new pet. The screen has a light green background. At the top, the status bar shows the time 4:46, signal strength, Wi-Fi, and battery. Below the status bar is a header with a back arrow and the text 'Add Pet'. The main form area contains several input fields: a photo upload section with a camera icon and the text 'Add a photo (optional)'; a text field for 'Pet name'; a dropdown menu for 'Species' with 'Dog' selected; a text field for 'Age (years, optional)'; and a text field for 'Notes (optional)'. At the bottom is a large green button with a white checkmark and the text 'Save Pet'.

## User Interface Wireframe(s)

This is the login page where the user logs in to the PetAlert app

This is a missing pet alert page, where a user needs to report a missing pet by clicking the button

This displays a list of pets, that the user inputs. If the user wants to add a new pet there is a green button above.

This is a pet profile page where it shows the pet account info

This page lists all the emergency contacts for that specific pet in case they need help

This page will show the infographic of toxic foods that pets can't eat

## Design Summary

The design of PetAlert advanced significantly during Sprint 3 with the introduction of Firebase Authentication, which adds secure login and signup flows to the system. This update ensures that each user has a private environment for managing their pet profiles and missing alerts.

The interface now includes new authentication screens following the same clean, accessible visual style introduced in Sprint 2. Once a user logs in, the Home Screen displays all primary features, including the newly completed Missing Alerts module.

The Missing Alert system now supports creating, storing, and reviewing alerts directly on the device. Each alert includes last-seen information, notes, timestamps, and status indicators (Active or Resolved). The design emphasizes clarity and emotional ease of use, especially during stressful emergency situations.

During Sprint 3, UI refinements were also made across modules to ensure consistency and improve action visibility. Buttons, spacing, icons, and text hierarchy were adjusted to guide users smoothly through key tasks.

These additions position PetAlert for future cloud synchronization while preserving its core offline-first reliability.

## **Design Rationale**

The design decisions in Sprint 3 focused on balancing security, usability, and emergency readiness. Firebase Authentication was implemented to give each user a secure and personalized space without disrupting the offline-first model established in Sprint 2.

The Missing Alerts module was prioritized because it provides immediate practical value to users during emergencies. The interaction flow was intentionally kept simple: select a pet → enter last seen info → save the alert. Information is stored locally so users can take action even without internet access.

Consistent UI design principles were preserved: minimal navigation depth, large readable text, and clear visual hierarchy. Sprint 3 screens maintain the same color palette and rounded card style used in earlier versions to provide continuity and reduce learning curve.

This sprint laid the foundation for future cloud integration (e.g., syncing pet profiles, sharing alerts) but intentionally avoided adding complexity prematurely. The resulting design remains stable, intuitive, and optimized for real-world emergency situations.
